15 June 1945

1. "Index of Army-Navy R.F. Transmission Lines and Fittings", (NavShips 900,102, Army No. 71-4925) has been prepared by the Army-Navy R. F. Cable Coordinating Committee.

2. This publication is a revision of the former index, RE 9196B, and has been prepared as a guide for design agencies, manufacturers, procurement and installation activities. The information listed herein contains practically all the types listed in RE 9196B plus many new and old types which were formerly not listed.

3. Comments, criticism and additional material are solicited. Address all communication to the Army-Navy R. F. Cable Coordinating Committee, Code 930G, Bureau of Ships, Navy Department, Washington 25, D. C.

4. Additional copies may be obtained either from the Bureau of Ships, Washington 25, D. C. or the Army Electronics Standards Agency, 12 Broad Street, Red Bank, New Jersey.

G. C. IRWIN,
Colonel, Signal Corps,
Commanding Officer,
Army Electronics Standards Agency

E. L. COCHRANE,
Vice Admiral, USN.,
Chief of the Bureau of Ships

Chapter I—INTRODUCTION

The nomenclature and drawing indices in the index are provided for the purpose of easy access to the information contained in the book. With a nomenclature or drawing number available, the index will immediately give the page number where information concerning the particular connector may be found.

A brief description precedes each group of lines and fittings. Its purpose is to explain the major relevant facts pertaining to each group. Further information can be obtained from the applicable drawings and references.

Transmission lines and fittings which are covered by Army-Navy directives are listed as *first category* components. New types, produced since the directives were issued and other types which are satisfactory and have found wide use are listed as *second category* items. These items may be covered by Army-Navy directives in the future. Either first or second category items *must* be used in all new equipments. Certain other components have been used for application where more satisfactory components are now available in the first and second categories. These components are listed in the *third category*. It is permissible to continue the use of these components in existing equipments but it is advisable to change to first or second category components wherever possible. Various other components, which in many cases were not designed for r.f. applications, have been used in electronic equipments. These components are listed in the *fourth category*. Any of these components, now being used in equipments in current production, should be replaced by first or second category components. In the event that no suitable line or fitting is listed in this index, it is necessary that the problem be brought to the attention of the Army-Navy R.F. Cable Coordinating Committee.

The Joint Army-Navy Nomenclature system has supplied component indicators for radio frequency transmission lines, associated fittings and transmission line assemblies. The indicator RG- /U is assigned to R.F. transmission lines. This includes flexible cables, gas filled bead supported, coaxial, stub supported coaxials and wave guides. The indicator UG- /U is assigned to the R.F. connectors, fittings and adapters used with the above transmission lines. The indicator CG- /U is assigned to lengths of transmission lines which are terminated with appropriate connectors and fittings.

The listings include a reference to manufacturers who are currently producing or are in a position to supply these components. The names and addresses of manufacturers may be found in the appendix.

Chapter 2—R. F. CABLES

The R.F. Cables listed herein are divided into the following paragraphs for convenience. The *Army-Navy Standard List of Cables* dated 15 October 1944 (paragraph 1) indicates those cables which have been standardized for use in Army and Navy radio and radar equipments.

The following tables also appear:

(1) A listing of nonstandard cables which are still in use in various old equipments and which are to be used for replacement purposes only.

(2) A complete list of pulse cables including four new cables which are considered standard cables.

(3) A listing of R.F. cables by the diameter over the dielectric. This list includes RG-79/U which is also considered a standard cable.

A list of cable manufacturers is included at the end of this section.

I. Army-Navy Standard List of Radio Frequency Cables

15 OCTOBER 1944

NOTE: This standard list supersedes the Army-Navy standard list of Radio Frequency Cables dated 18 November 1943.

TO: OFFICE OF THE CHIEF SIGNAL OFFICER; ALL FIELD ACTIVITIES UNDER THE CONTROL OF THE CHIEF SIGNAL OFFICER.
ALL BUREAUS; ALL INSPECTORS OF NAVAL MATERIAL; COMMANDANTS, ALL NAVY YARDS; SUPPLY OFFICERS IN COMMAND, ALL NAVAL SUPPLY DEPOTS.
ALL THOSE CONCERNED WITH THE DESIGN AND MANUFACTURE OF ARMY OR NAVY EQUIPMENT UTILIZING R. F. CABLE AND PULSE TRANSMISSION CABLE.

1. The following Army-Navy standard list of radio frequency cables has been selected by the Army-Navy R. F. Cable Coordinating Committee. The purpose of this list is to limit the number of types of cables used for radio frequency transmission, video, intermediate frequency, radio frequency test equipment, and pulse transmission used in Army-Navy Electronic equipment.

2. IT IS MANDATORY THAT ALL RADIO FREQUENCY AND PULSE TRANSMISSION CABLES FOR THE ABOVE APPLICATIONS FOR USE IN NEW EQUIPMENTS OR EQUIPMENTS IN THE DESIGN STAGE BE SELECTED FROM THIS STANDARD LIST. NO OTHER CABLES OF THE SUBJECT TYPE SHALL BE MANUFACTURED EXCEPT THOSE LISTED IN PARAGRAPH 3 AND THOSE CABLES REQUIRED FOR MAINTENANCE OF EQUIPMENTS IN THE FIELD FOR WHICH NO CABLE ON THE STANDARD LIST IS APPLICABLE.

3. The following non-standard cables, RG-7/U, RG-15/U, RG-23/U, RG-24/U, RG-29/U, RG-34/U, RG-35/U, RG-39/U, RG-42/U, and RG-54A/U, appeared on the previous standard list of cables dated 18 November 1943. These cables shall not be used in new equipments and may only be used in equipment in current production or for field replacement purposes.

4. In the event that it is believed that certain equipment of new design requires a special cable which is not included in the standard list, a specific waiver to use such a cable must be obtained from the Army-Navy R. F. Cable Coordinating Committee. Requests for such waivers, accompanied by a statement giving the engineering considerations which make the proposed type necessary, shall be forwarded to the Army-Navy R. F. Cable Coordinating Committee. The request shall be forwarded in the case of Army equipment, via the cognizant Service laboratory and the officer in charge, R. F. Cable Section, Signal Corps Standard Agency. In the case of Navy equipment, the request shall be forwarded via the Chief of the Bureau of Ships, Navy Department, Code 930, Washington, D. C.

5. The provisions of this directive are in no way intended to hamper or restrict new developments to the field of R. F. Cables.

6. This directive shall take effect immediately.

Office of the Chief Signal Officer
Headquarters, Army Service Forces
War Department

Chief of the Bureau of Ships
Navy Department

.285	63A	1	125.0	I	Low capacity cable.
.285	79A	1	125.0	I	X	Armored RG-63A/U. .475" Max. dia. over armor.
.288	25A	2	48.0	V	Replaces RG-25/U. Uses field assembly connectors.

4. Standard R.F. cables in order of diameter over dielectric (continued)

D.O.D.	RG-/U Type	Number of Braids	Nominal Impedance Ohms	Jacket Type Note (1)	Armored	Remarks
.288	26A	1	48.0	V	X	Replaces RG-26/U.
.288	77	2	48.0	III	Replaces KS-9275. Uses field assembly connectors.
.288	78	1	48.0	III	Replaces KS-8623. Uses field assembly connectors.
.308	64A	2	48.0	IV	Medium size pulse cable.
.308	25	2	48.0	IV	Special twist pulse cable.
.308	26	1	48.0	IV	X	Med. size armored pulse cable.
.370	14	2	52.0	II	Gen'l purpose—semi-flexible cable.
.370	74	2	52.0	II	X	Armored RG-14/U. .615" Max. dia. over armor.
.455	27	1	48.0	I	X	Large size armored pulse cable.
.455	28	2	48.0	IV or V	Large size pulse cable.
.472	57	1	95.0	I	Large size twin conductor cable.
.680	17	1	52.0	II	Large—high power low loss cable.
.680	18	1	52.0	II	Armored RG-17/U.
.910	19	1	52.0	II	Very large—high power low loss cable.
.910	20	1	52.0	II	Armored RG-19/U.

General Note:

Type RG-79A/U does not appear on the present Standard List of R.F. Cables. It is intended to include this type on the next list. Armor is identical to that on RG-12/U.

Note (1)

- I—Vinyl
- II—Vinyl—non-contaminating resin
- III—Polyethylene
- IV—Neoprene
- V—Synthetic Rubber

5. R. F. cable manufacturers

The following R.F. cable manufacturers are able to supply the general types of cable as indicated. Information on specific type approvals may be obtained by applying to the Army-Navy R.F. Cable Coordinating Committee, code 930G, BuShips, Washington, D. C.

Manufacturer	CABLE TYPE			Manufacturers Index No.
	Polyethylene	Pulse	Rubber	
American Phenolic Corp.	X			3
American Steel & Wire Co.		X		6
Anaconda Wire & Cable Co.	X			7
Federal Telephone & Radio Corp.	X			31
General Cable Corp'n.	X			32

Chapter 3—R. F. CONNECTORS

The following section includes listing of all recommended or commonly used R. F. connectors used with R. F. flexible cables. The adapters used between flexible cables and rigid lines are also included. The *Army-Navy Standard List of Radio Frequency Cable Connectors for Small and Medium Size R. F. Cables* dated 1 October 1944 is included for ready reference.

The connectors have been divided into various groups according to their functional use and have been arranged generally in accordance with the size of the cables with which they are used.

The N series of connectors has been evolved from the original type N constant impedance connector since they have many characteristics similar to the original N connector. The BN refers to a series of small size connectors used with the small R. F. cables. Literally speaking, they are known as "baby N" connectors. The BNC connectors are somewhat similar to the BN but are electrically improved to provide very little electrical discontinuity at high frequencies. The nomenclature BNC is derived from the fact that they have electrical characteristics similar to constant impedance connectors. The LN series are large size connectors very similar in construction and electrical properties to the original N series. The HN series refers to the connectors of similar size to the N connector. They are designed for use at higher voltages.

Each series of connectors includes a functional diagram showing the various ways in which the individual connectors may be used between cables and between cables and rigid lines. A listing of each individual connector and adapter gives the nomenclature, applicable specifications, AN drawings and a reference to the manufacturer's name and address.

Following this listing in each section are outline drawings which show the approximate size and shape of the individual connectors.

I. Army-Navy Standard List of Radio Frequency Cable Connectors for Small and Medium Size R.F. Cables

1 October 1944

TO: ALL THOSE CONCERNED WITH THE DESIGN, PROCUREMENT AND MANUFACTURE OF ARMY OR NAVY EQUIPMENT UTILIZING RADIO FREQUENCY CABLE CONNECTORS.

1. The following Army-Navy Standard List of Radio Frequency Cable Connectors has been selected by the Army-Navy R.F. Cable Coordinating Committee as containing the most satisfactory types of connectors to be used with the standard Radio Frequency Cables in Army-Navy Electronic equipment. The purpose of this list is to effect a reduction in the number of types of R.F. connectors and to insure that only connectors expressly designed for use at radio frequencies be used in Service Equipments.

2. This list covers cable to cable connectors to be used with the following standard R.F. cables in applications such as video transmission, R.F. transmission, trigger, gate and timing pulse circuits and R.F. test equipment:

RG-5/U	RG-11/U	RG-29/U	
RG-6/U	RG-12/U	RG-39/U	RG-63/U
RG-7/U	RG-13/U	RG-57/U	RG-65/U
RG-8/U	RG-14/U	RG-58/U	RG-55/U
RG-9/U	RG-21/U	RG-59/U	RG-71/U
RG-10/U	RG-22/U	RG-62/U	RG-72/U

3. IT IS MANDATORY THAT ALL R.F. CONNECTORS FOR THE ABOVE APPLICATIONS, TO BE USED IN NEW EQUIPMENTS OR EQUIPMENTS IN THE EARLY DESIGN STAGE, UNDER THE JURISDICTION OF THE ARMY OR NAVY, BE SELECTED FROM THIS LIST.

4. In the event that it is believed that certain equipment of new design requires a special connector for which a suitable design is not included in the Standard List, a specific waiver to use such a connector must be obtained from the Army-Navy R.F. Cable Coordinating Committee. Requests for such waivers, accompanied by a statement giving the engineering considerations which make the proposed type necessary, shall be forwarded to the Army-Navy R.F. Cable Coordinating Committee. The request shall be forwarded, in the case of Army Equipment, via the Officer-in-Charge, R.F. Cable Section, Signal Corps Standards Agency, Red Bank, N. J., or in the case of Navy Equipment, via the Chief of the Bureau of Ships, Navy Department, Code 930, Washington 25, D. C.

5. Special R.F. components, which incorporate connectors as an integral part, and for which standard connectors require modification for electrical or mechanical reasons are not affected by the provisions of this directive, providing the external termination mates with the standard connectors. Connectors used between standard cables and Klystron tubes are not affected by the provisions of this directive.

6. An adapter is defined as a part of an R.F. connector in the form of an auxiliary fitting which is inserted between portions of a connector and does not connect directly to a cable at either end. Such adapters are covered by the provisions of this directive; but adapters which are used to couple standard connectors to non-standard connectors or to connectors of different size are not so covered by this directive.

7. The provisions of this directive are in no way intended to hamper or restrict new developments in the field of Radio Frequency transmission.

8. The provisions of this directive shall take effect immediately.

Office of the Chief Signal Officer
Headquarters, Army Service Forces
War Department

Chief of the Bureau of Ships
Navy Department

i. Type BN low voltage non-constant impedance cable connectors

A-N Type No.	Description	Cable Type	Nominal Impedance	Army Dwg. No.	Navy Dwg. No.	Remarks

UG-27A/U	Adapter—Rt. Angle		50 ohms	JAN-C-71		Mates with UG-18/U UG-21/U plugs.
UG-30/U	Adapter—Straight 2 female ends (Pressurized)			JAN-C-71		
UG-58/U	Receptacle			JAN-C-71	RE-49F-254	
UG-107/U	Adapter—Tee 2 female ends, 1 male end			JAN-C-71	RE-49F-262	
UG-57/U	Adapter—Straight 2 male ends			JAN-C-71	RE-49F-259	
UG-29/U	Adapter—Straight 2 female ends			JAN-C-71	RE-49F-258	
UG-106/U	Hood			(Army Dwg. SC-B-5849)	RE-49F-167	Use with UG-58/U.

iv. Type HN high voltage constant impedance cable connectors

A-N Type No.	Description	Cable Type	Nominal Impedance	Army Dwg. No.	Navy Dwg. No.	Remarks
UG-59/U	Plug	RG-8/U	50 ohms		RE-49F-225	Weatherproof—Requires special cable tapering tool, MX-103/U to assemble to cable.
UG-60/U	Jack				RE-49F-225	
UG-61/U	Panel Jack					
UG-212/U	Adapter—Rt. Angle		50 ohms		RE-49F-349	

v. Type LN low voltage constant impedance cable connectors

A-N Type No.	Description	Type Cable	Nominal Impedance	Army Dwg. No.	Navy Dwg. No.	Remarks
UG-100/U	Plug	RG-14/U	50 ohms		RE-49F-292	Weatherproof—(Radio Research Laboratory Dwg.) S-101-B1
UG-101/U	Panel Jack	RG-14/U	50 ohms		RE-49F-287	(R.R.L. Dwg.) S-102-B1
UG-98/U	Receptacle		50 ohms		RE-49F-290	(R.R.L. Dwg.) S-103-B1
UG-97/U	Adapter—Rt. Angle				RE-49F-291	(R.R.L. Dwg.) S-121-B1
UG-109/U	Adapter—Straight 2 female ends		50 ohms			(R.R.L. Dwg.) S-120-B1

2. BN Connectors

The connectors described in this section are BN type small lightweight connectors and are designed for use with small cables such as RG-58/U, RG-59/U etc.

They are widely used for video, i.f., trigger pulse and low power r.f. applications. They are not constant impedance and are therefore not recommended for applications where frequencies are in excess of approximately 200 mc. unless the electrical requirements of the circuit are not critical. They may be used at voltages up to 250 volts peak. An adapter is available for use between these connectors and the UHF series. Modified versions of these connectors are being used in multi-contact, Army-Navy aeronautical type connectors.

NOTES:

- (1) To be used only inside of equipments
- (2) Replaced by UG-85/U
- (3) Replaced by UG-115/U
- (4) Requires MX-195/U hood for connecting braid of RG-58/U cable and MX-367/U hood for RG-62/U, RG-59/U and RG-71/U cables.
- (5) Has long threaded body for 5/16" panels.
- (6) Mates with UG-86/U or similar at one end and 49195 or similar at other end.
- (7) Cable assembly instructions are shown on AN drawings RE 49F 357 and RE 49F 358.

3. BNC Connectors

The items described in this section are small, lightweight, quick connect and disconnect connectors and are known as BNC. They are designed for use with the small R. F. cables. Types are available for use with RG-58/U, RG-59/U, RG-62/U and RG-71/U.

They may be used for application where the peak voltage does not exceed 500. They are not constant impedance connectors but are designed to produce very little electrical discontinuity in a coaxial line of 52 ohms. Samples have been tested and show a voltage standing wave ratio of approximately 1.05 at 1,000 mc/sec. and 1.15 at 3,000 mc/sec. They are recommended for use at frequencies as high as 3,000 mc where impedance matching is important. Adapters are available between these connectors and types N and UHF.

These connectors have been tentatively adopted as standard for aircraft test equipment.

UG-274/U	Adapter (Tee).....	2	RE 49F 390	Yes	1 Male 2 Fem. ends	39
UG-306/U	Adapter Rt. Angle.....	2	Yes

NOTES:

- (1) Use MX-195/U Hood for RG-58/U or MX-367/U hood for RG-59/U, RG-62/U or RG-71/U cables.
- (2) Fits all jacks and receptacles.
- (3) Used to mount UG-90/U and UG-185/U. Has four tapped holes.
- (4) Mates with UG-22/U or similar at one end and UG-88/U or similar at other end.
- (5) Mates with UG-90/U or similar at one end and 49190 or similar at other end.
- (6) Mates with UG-88/U or similar at one end and 49194 or similar at other end.
- (7) Cable assembly instructions are shown on AN drawing RE 49F359.

4. UHF Connectors

The connectors described in this section are known as UHF connectors. They may be used with numerous small and medium size cables. They are not constant impedance and will therefore introduce some voltage reflection. They are generally satisfactory at frequencies up to 200 megacycles and may be used with caution up to 500 megacycles. They may be used at voltages up to 500 volts peak.

These connectors are generally available and are recommended for use where low cost, general-purpose connectors are required and where they will not be exposed to the weather. Adapters are available for use between these connectors and type N, British "Pye", BN, and BNC.

These connectors are available in small and large coaxial types, small twin conductor types and large twin conductor types.

NOTES:

- (1) Similar to 49195 except cable end is reduced in diameter to fit small cables.
- (2) Mounts in 3/8" hole. Designed for and recommended to replace British panel mounting connectors. Mates with 49195 and similar UHF connectors.
- (3) Similar to 49192 except has better electrical properties.
- (4) Provides cable to cable connection by coupling two 49195 or similar plugs.
- (5) Similar to 49191 except 2" long and body threaded full length and has two hex mounting nuts.
- (6) Similar to PL-274 except 1-3/8" long.
- (7) For use with 49190 or 49195 plugs and adapts back end to smaller cables.
- (8) Mates with UG-23/U or similar at one end and 49190 or similar at other end.
- (9) Mates with UG-21/U or similar at one end and 49194 or similar at other end.
- (10) Mates with Jones jack at one end and 49190 or similar at other end.
- (11) Mates with 49194 or similar at one end and 10H-365 or similar at other end.
- (12) Mates with 49190 or similar at one end and 10H-588 or similar at other end.
- (13) Mates with 49190 or similar at one end and 110H-585 at other end.
- (14) Mates with 49194 or similar at one end and 110H-584 at other end.
- (15) See BNC Section.
- (16) See BN Section.

NOTE:

(1) Similar to Amphenol 83-21SP with cable end reduced in diameter to fit RG-14/U Cable.

5. Type N Connectors

These connectors are known as type N and are designed for use with RG-8/U or similar size cables. These connectors are available in both weatherproof and non-weatherproof types. The weatherproof types are commonly used and are recommended for all applications whether or not the connector is exposed to moisture. The non-weatherproof types can be used to advantage on cable assemblies or special assemblies inside equipments where they will not be exposed to the weather.

The characteristic impedance of N connectors is 50 ohms. They may be used with 70 ohm cables where impedance matching is not necessary. 70 ohm plugs and jacks are available for use with 70 ohm cables where impedance matching is necessary.

The weatherproof type N connectors require special care in assembling to the cable.

Type N connectors and adapters (50 ohms)

NOTES.

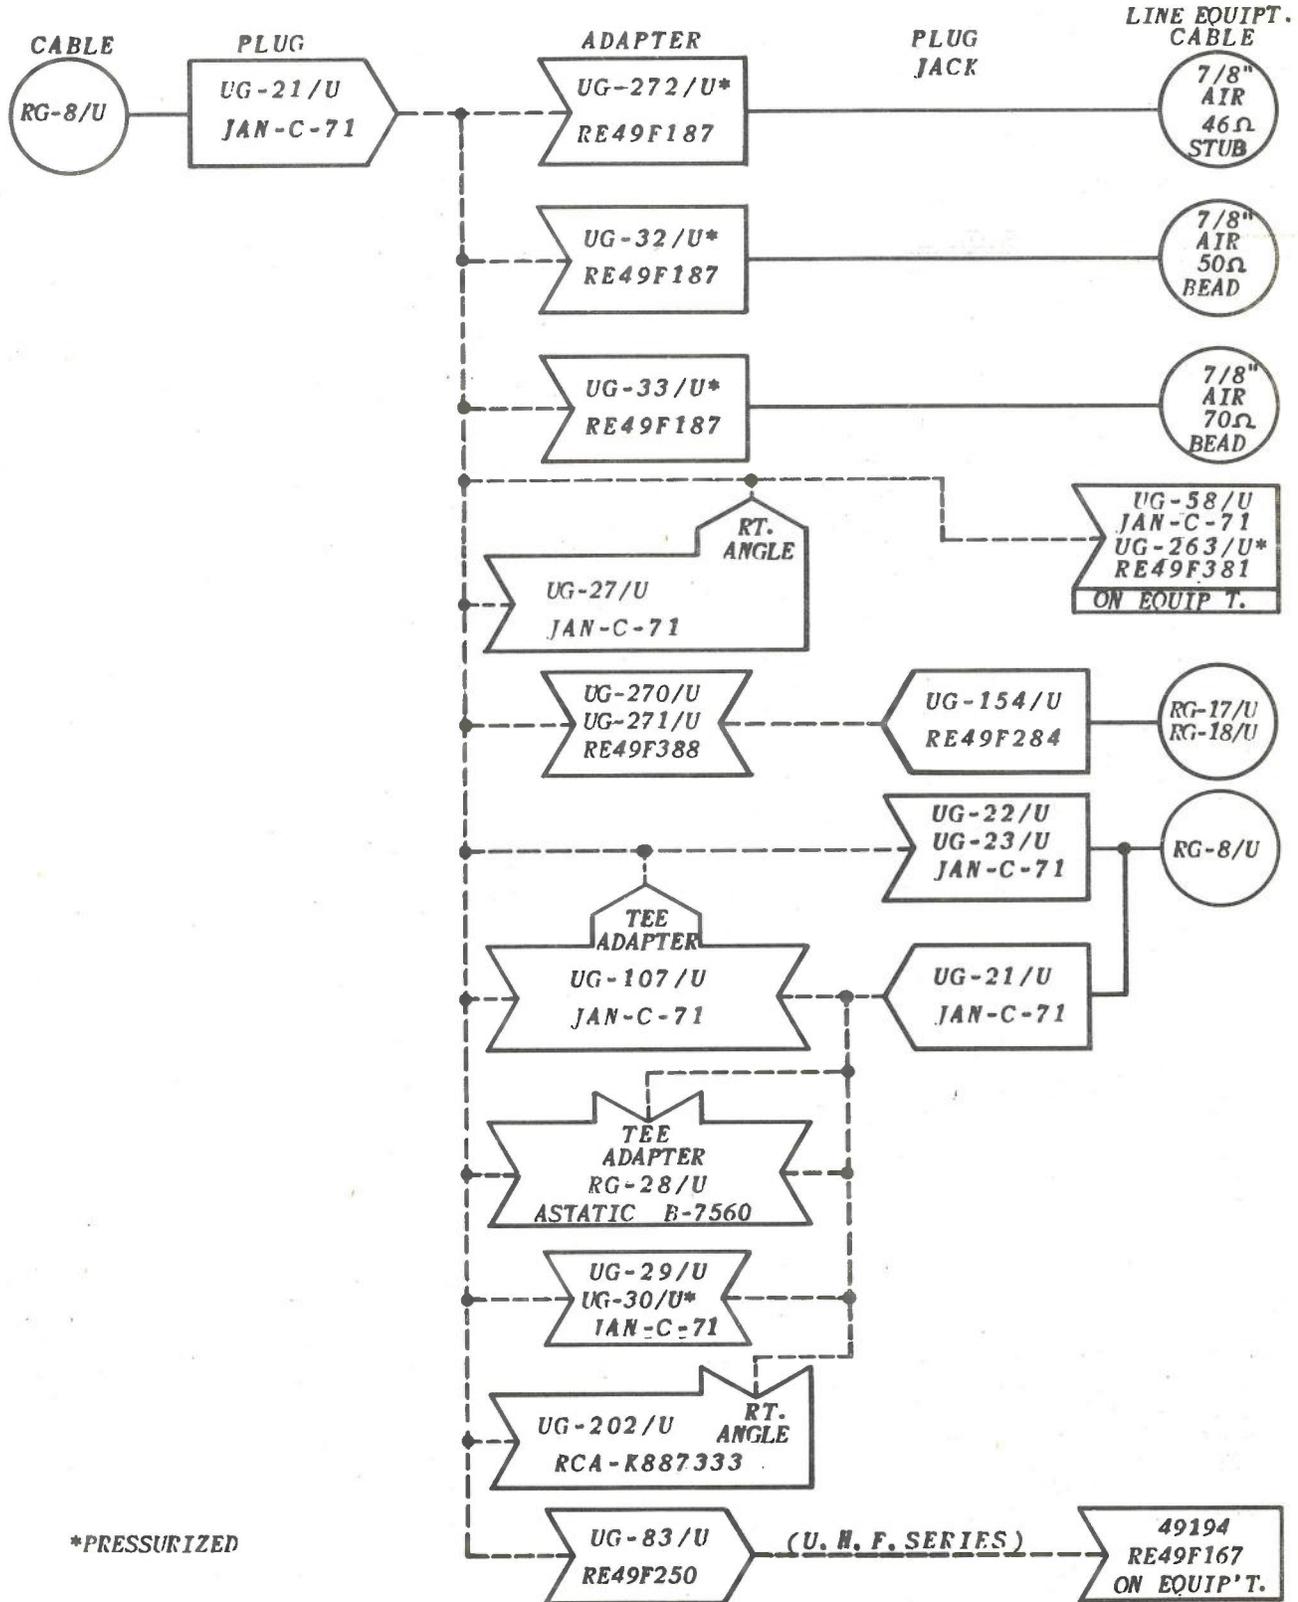

- (1) Improved mechanically.
- (2) Similar to UG-18A/U, UG-19A/U and UG-20A/U with lower reflection at microwave frequencies.
- (3) Similar to UG-21A/U, UG-22A/U and UG-23A/U except with lower reflection at microwave frequencies.
- (4) Connects to RG-17/U or RG-18/U cable and couples to UG-23/U or similar jack.
- (5) Similar to UG-12/U except for use with 0.116 D.O.D. cables such as RG-58/U.
- (6) Similar to UG-21/U except back end is the same as UG-100/U
- (7) Mounts on panel and cable fastens directly to jack inside of equipment.
- (8) Single hole panel mounting.
- (9) Similar to UG-58/U except has special connection for RG-58/U cable.
- (10) Used to clamp armor.
- (11) Similar to UG-27/U except smaller in size and has lower electrical reflection.
- (12) Similar to UG-27A/U except one leg is lengthened and provided with a flange for panel mounting.
- (13) See BNC Section.
- (14) See UHF Section.
- (15) Mates with UG-21/U or similar at one end and UG-100/U at other end.
- (16) Mates with UG-23/U or similar at one end and UG-100/U at other end.
- (17) See SKL Section.

RESTRICTED

- (18) Mates with Holmdel plug at one end and UG-23/U or similar at other end.
- (19) Mates with Holmdel jack at one end and UG-21/U or similar at other end.
- (20) See connectors for large size cables.
- (21) Connects to 7/8", 50 ohm, bead line. Use UG-21/U or equivalent to connect cable to this adapter.
- (22) Installation Instructions RE 49F 269.
- (23) Connects to 7/8", 70 ohm, bead line (Impedance discontinuity).
- (24) Connects to 7/8", 46 ohm, stub line.

UG-96/U	Panel Jack.....	1	53	JAN-C-71	11, 12, 13	Yes	(1)	46, 51, 75
UG-96A/U	Panel Jack.....	2	RE 49F 402	11, 12, 13	Yes	(1, 2, 3)

NOTES:

- (1) These connectors should only be used where 70 ohm impedance matching is necessary. They will not properly mate with any of the 50 ohm N connectors.
- (2) Improved mechanically.
- (3) Use MX-564/U to clamp armor for shipboard.

6. HN Connectors

These connectors are known as HN, high-voltage, connectors. They are designed for use with RG-8/U cable. They have constant impedance, 52 ohms, and are weatherproof. They can be used up to 4,000 volts peak, at 50,000 feet altitude. Their voltage rating is improved by the application of Dow-Corning #4 ignition sealing compound to the tapered cable dielectric surfaces, and to the connector dielectric mating surfaces. Certain adapters are available for use between these connectors and large size cable connectors and also to certain types of rigid lines. (See adapters to rigid lines.)

Type HN connectors

Type HN connectors (cont.).

Type HN connectors for RG-8/U or RG-10/U cable.

7. Type LN Connectors

The type LN connectors are similar to, but are larger than, the type N connectors. They are used only with RG-14/U R. F. cable. They are 50 ohms and are weatherproof. The approximate voltage rating is 1,000 v peak. Adapters can be used to connect these fittings to type N for applications where RG-14/U is to be introduced in a circuit requiring lower attenuation than that of RG-8/U.

8. British Connectors

The connectors described in this section are known as British connectors and are used with RG-7/U and RG-8/U cables. They are widely used in British equipments and have been used to some extent in American equipments. The electrical and mechanical design of the connectors is not considered as satisfactory as the comparable American types, such as UHF and N.

These connectors should not be used in any new equipments. Adapters are available from most British types to standard American types. The use of these adapters is strongly recommended wherever British connectors are encountered which cannot be replaced by standard type.

A UHF receptable, UG-223/U, has been designed to mount in the same hole as the British panel plug 10H-528 and should be used to replace 10H-528 wherever possible.

A British report has been prepared which is essentially a standard list for British Connectors. It is entitled "Interim Working Schedule of R. F. plugs and Sockets" R.C.L./322, Issue 1, June 1944 and was issued by the Inter-Services Components Technical Committee, Regent Arcade House, Regent Street, London, W. 1.

9. SKL Connectors and Adapters

SKL connectors were originally designed to provide a connection to a Klystron tube. Various modifications were subsequently designed to provide general purpose cable to cable connections.

Only the Klystron connectors and adapters to type N should be used in new equipments. The other modifications should not be used because existing standard types such as BN, BNC and type N perform the same function and are more generally available.

SKL connectors and adapters

AN type	Name	Category	Fig no.	Navy type	ANRFCC or Navy draw. no.	Army or other type no.	Army or other draw. no.	Fits RG- /U cable	Weather proof	Notes	Mfg. code

10. Miscellaneous Connectors and Adapters

The connectors and adapters listed in this section are of various types which do not fit in any of the other listings. In practically all cases they are obsolete designs which should not be used for R. F. applications in new equipments under any conditions. Many of these connectors were designed for audio frequencies and are suitable for such use but do not have the electrical properties required for R. F. applications.

Miscellaneous connectors and adapters

II. Connectors for Large Size Cables

These connectors are of 52 ohms characteristic impedance and are weatherproof.

With appropriate preparation these connectors may be used with RG-18/U as a low voltage or high voltage assembly. Where it is desired to operate the plug UG-154/U as a low voltage connector the cable dielectric is butted flush against the dielectric in the mating connector. Where the UG-154/U plug is used for high voltage applications a counter boring operation is performed with a special tool TL-326/U on the end of the cable dielectric.

For RG-20/U the connectors indicated are all of the high voltage type, and consequently, a counter boring operation on the end of the dielectric in the UG-156/U plug must always be performed with the special tool TL-325/U.

The voltage rating for the low voltage types for RG-18/U is 5,000, and 10,000 for the high voltage types with counter-bored dielectrics. The voltage rating for the RG-20/U connectors is in excess of 10,000. Dow-Corning #4 ignition sealing compound should always be used on the faces of the dielectric mating parts on all these connectors.

Those connectors, designated "special" on the tabulations, have been designed for a specific Navy equipment. They are not recommended for use in new equipments. They introduce considerable discontinuity at high frequencies, and other more satisfactory types previously described are available.

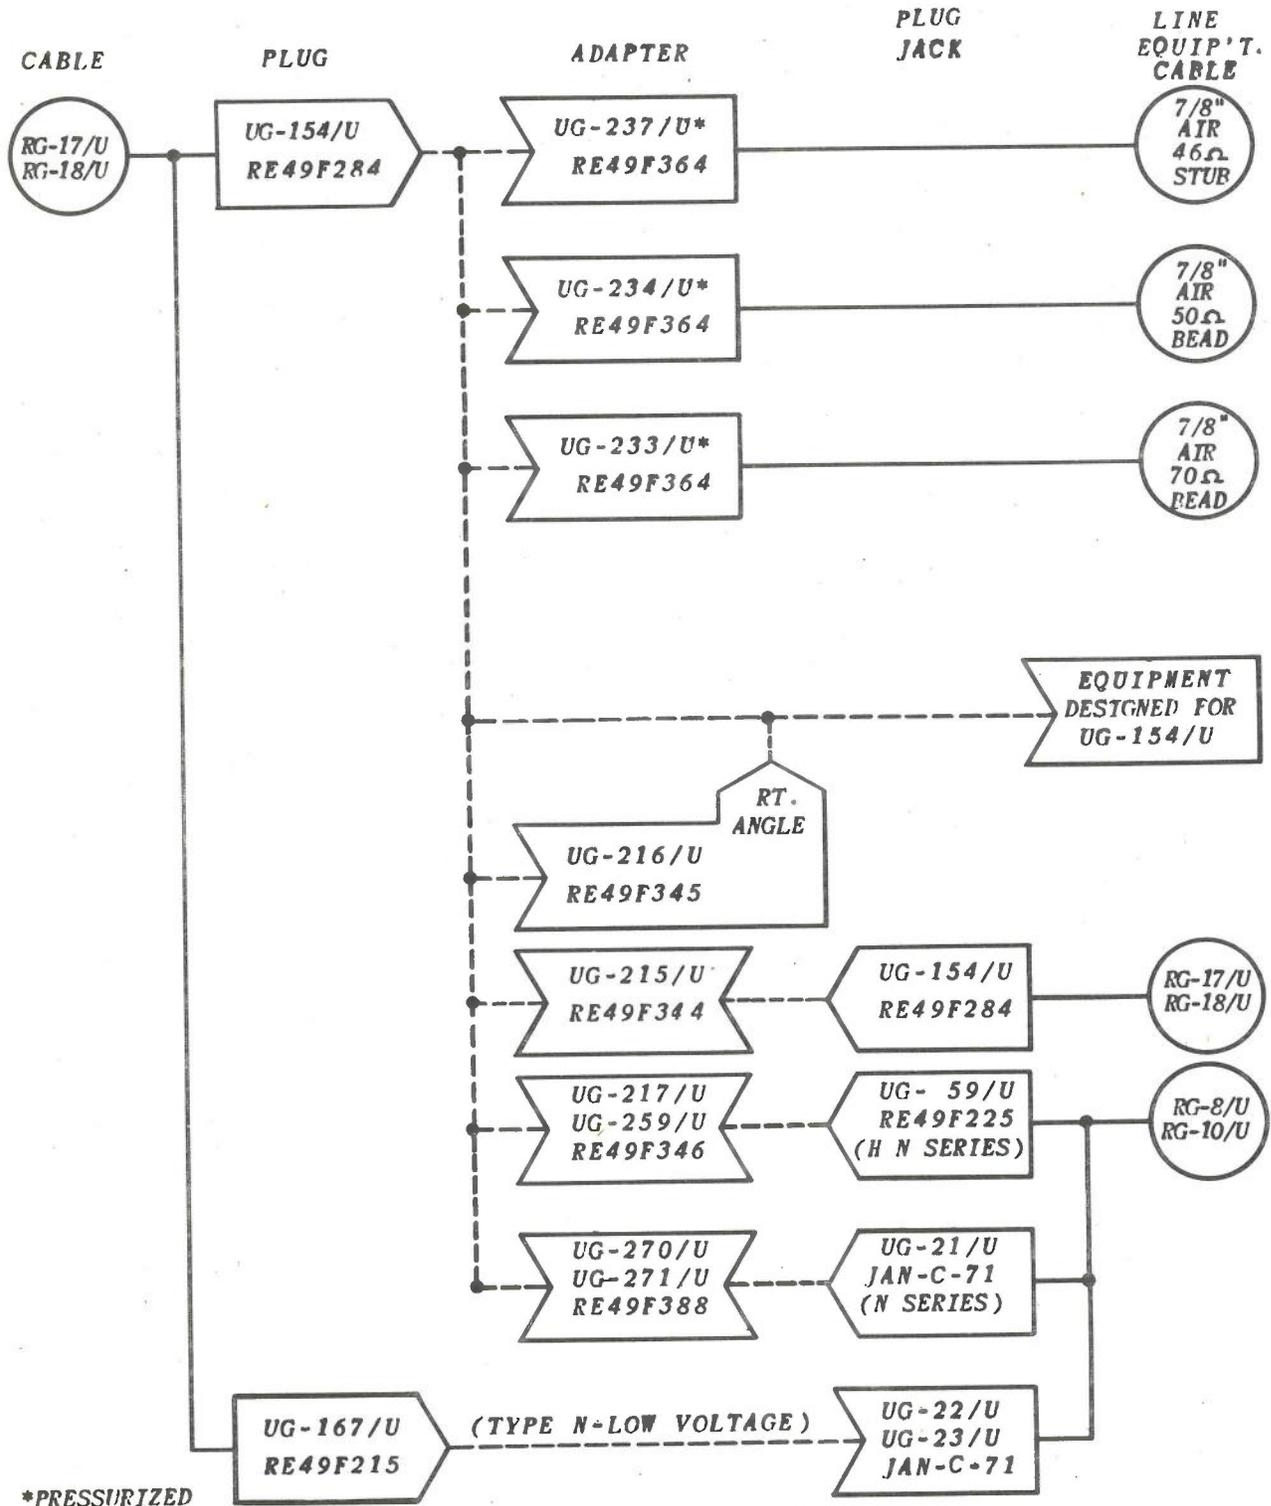

Voltage rating is approximately 2,000 volts peak. Adapters are available between these connectors and rigid lines.

Connectors for large size cables

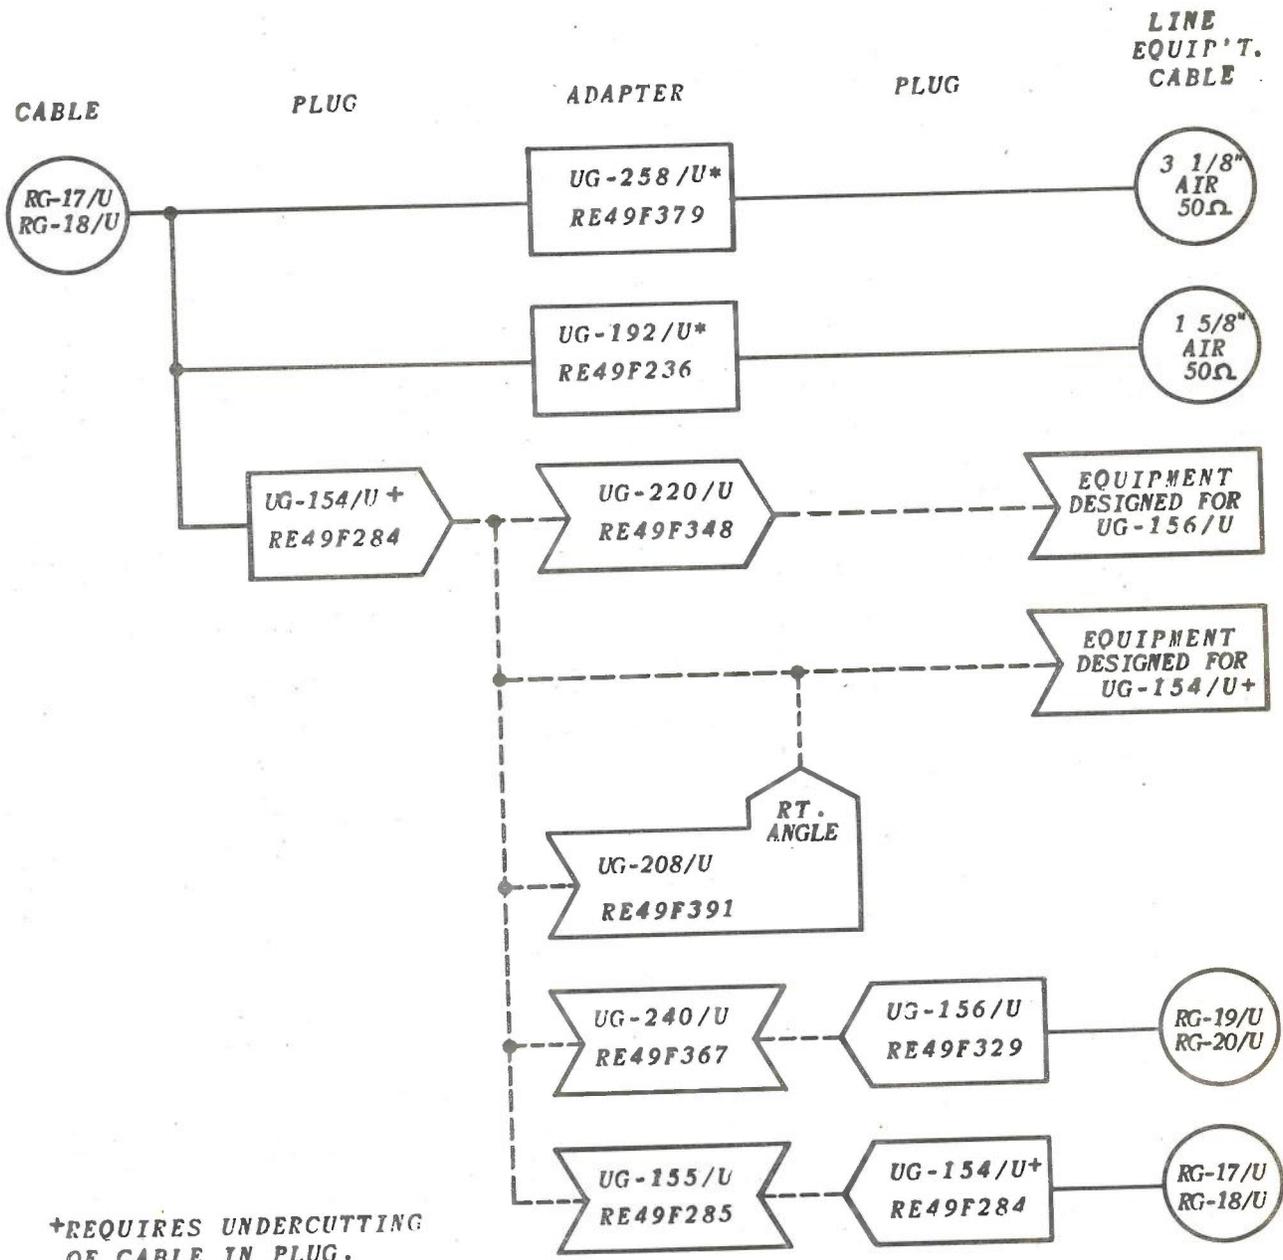

AN type	Name	Category	Fig no.	Navy type	ANRFCCC or Navy draw. no.	Army or other type no.	Army or other draw. no.	Fits RG- /U cable	Weather proof	Notes	Mfg. code

12. Adapters (Cable to Rigid Line)

The following groups of adapters provide means of connecting solid-dielectric, R. F. cable and rigid, bead-supported, or stub supported, coaxial, transmission lines.

These adapters are divided into the four following groups:

1. Adapters, couple to rigid line, require plug to connect cable to adapter. Can be field assembled.
2. Adapters, high voltage, couple to rigid line. Cable connects directly to adapter. Can be field assembled.
3. Adapters, low voltage, couple to rigid line. Cable connects directly to adapter. Can be field assembled.
4. Adapters, couple to rigid line. Cable molded permanently into adapter. Can not be field assembled.

The adapters shown in groups 1 and 2 are preferred. Those shown in group 3 have, in general, been designed for specific applications, and are not recommended for general use. Group 4 covers factory-molded adapter. They must be factory assembled, as dielectric material, normally polyethylene, must be injected into the adapter body and be bonded to the cable dielectric. No design of this type is considered pressure-tight. Normally they are furnished molded to a specified length of cable. When required additional lengths of cable can be molded to the cable protruding from these adapters. See splicing technique for R. F. cables.

Adapters, pressurized—Requires plug to connect cable to rigid line

13. Pulse Connectors—Ceramic Insert Type

The ceramic insert pulse connectors listed in this section are commonly known as types A and B. The type A connectors have been widely used in Naval aircraft equipments. At very high altitudes they occasionally flash-over across the ceramic insert. No damage is caused by the flashover and they may continue to be used as soon as the voltage stress is relieved. The chief difficulty with the type A connector is the relatively poor grounding between the mating connectors. This causes excessive noise where they are used near communication equipment.

The type B connectors are considered as standard for use with RG-27/U and RG-28/U cable for shipboard and Signal Corps ground equipment. They may be used at voltage up to 15 KV peak. These connectors tend to leak noise. However, the problem is not as serious as with the type A because the equipments with which they are being used are generally not near communication equipments.

Chapter 4—RIGID WAVE GUIDES

This section is essentially a listing of rigid wave guides used in Army and Navy radio and radar equipments. The *Army-Navy Standard List of Wave Guides and Couplings* dated 10 October 1944 is included in this section although it contains in addition, the standard lists of wave guide couplings and flexible wave guide assemblies. These lists will not be duplicated in the applicable section.

1. Army-Navy Standard List of Wave Guides and Couplings

10 October 1944

TO: ALL THOSE CONCERNED WITH THE DESIGN, PROCUREMENT AND MANUFACTURE OF ARMY OR NAVY EQUIPMENT UTILIZING WAVE GUIDES AND ASSOCIATED COUPLINGS.

1. The following standard list of radio frequency rigid and flexible wave guides and associated couplings has been selected by the Army-Navy R. F. Cable Coordinating Committee. The purpose of this list is to standardize wave guides and couplings and effect a reduction in the number of types used in Army-Navy electronic equipment.
2. IT IS MANDATORY THAT ALL WAVE GUIDES AND COUPLINGS USED IN ARMY AND NAVY ELECTRONIC EQUIPMENTS BE SELECTED FROM THE FOLLOWING LIST.
3. Where an existing equipment or a new design equipment requires a guide or coupling for which a satisfactory type cannot be obtained from the standard list, it will be necessary to obtain a specific waiver from the Army-Navy R. F. Cable Coordinating Committee to use such a guide or coupling. Requests for such waivers, accompanied by a statement giving the engineering considerations which make the type necessary, shall be forwarded to the Army-Navy R. F. Cable Coordinating Committee. The request shall be forwarded in the case of Army equipment, via the cognizant Army laboratory and the Officer in Charge, R. F. Cable Section, Signal Corps Standards Agency. In the case of Navy equipment, the request shall be forwarded via the Chief of the Bureau of Ships, Navy Department, Code 930, Washington, D. C. with the standard wave guide couplings.
4. Special R. F. plumbing components such as mixers, T. R. boxes, feed horns, etc., are not affected by the provisions of this directive providing these special components have terminations which will mate with the standard wave guide couplings
5. Where wave guides and couplings not covered by the standard list are used in existing equipments, they may continue to be used pending action on requests for waivers.
6. The provisions of this directive are in no way intended to hamper or restrict new developments in the field of wave guide transmission.
7. The provisions of this directive shall take effect immediately.

Office of the Chief Signal Officer

Chapter 5—WAVE GUIDE COUPLINGS AND ADAPTERS

This section contains a listing of the widely used wave guide couplings and adapters required for connecting rigid and flexible wave guides.

The couplings are of two types, contact and choke. The contact type consists of two plain flanges which will mate with each other and are designed to produce a good electrical contact between each other. A gasket is usually provided for weatherproofing and in some cases pressurization. The choke type couplings consists of two parts, a plain flange and a choke flange. These two parts mate together to form a complete coupling. Electrical continuity is not dependant on a metal to metal contact between the two flanges. Nomenclature has been assigned in all cases to each metal flange.

Included are the outline drawings for these couplings and adapters. The standard listing of couplings is located in the preceding section, "Rigid Wave Guides".

The following convention has been established for the placement of wave guide choke couplings in R. F. transmission lines for all but K band equipments. A revised convention for K band equipments is available to those organizations cleared to receive confidential information.

1. Transmitters, receivers, antennas, test equipment assemblies and other major units shall be provided with choke flange terminations.
2. Sections of interconnecting rigid guide shall be provided with a plain flange on the end which is coupled to the choke flange termination of the major unit. Junctions between interconnecting sections of rigid guide shall be made with a choke flange-plain flange combination, with the choke flange placed nearest the antenna.
3. Wave guide couplings within major units and which are not subject to initial field installation are not covered by this convention.

Wave guide couplings and adapters

GENERAL NOTES:

First category items are listed in "Army-Navy Standard List of Wave guides and Couplings" dated 10 October 1944.

2" radius bends are not very good electrically. 3" radius, 6" radius or larger bends are recommended for RG-48/U waveguide.

3" and 6" radius, 45° and 90° prefabricated bends in both the E and H planes are available without couplings and with the various standard RG-48/U couplings.

NOTES:

(1) Includes UG-66/U couplings on each end.

(2) For use only inside of equipments.

Chapter 6—FLEXIBLE WAVE GUIDE ASSEMBLIES

This section contains a list of flexible wave guide assemblies. Standard flexible wave guide assemblies include a plain flange at each end except those assemblies used with UG-116/U and UG-117/U couplings; these assemblies are standard with a plain flange at one end and a choke flange at the other end. This change was recently agreed to by the principal users of this type assembly.

The length of the assembly is specified in the nomenclature by following the CG- /U with parenthesis containing the length in inches between the flange faces.

The standard listing of flexible wave guide assemblies is located in the previous section on "Rigid Wave Guides".

Flexible wave guide assemblies

NOTES:

(1) Vertebrae type of wave guide and has UG-116/U coupling one end and a UG-117/U coupling at other end.

*Length of wave guide between flange faces in inches.

Chapter 7—BEAD SUPPORTED COAXIAL LINES

It is recommended that only 52 ohm lines be used for new ground equipments. No bead lines are recommended for shipboard or aircraft use. This is due to the fact that under vibration and shock, bead lines require much maintenance to keep them pressurized. Furthermore, certain types of shock impulses cause ceramic spacers to shatter.

Bead supported coaxial lines

Communication Products, Inc. Manufacturers' code: 8-43-21.

NOTES:

- (1) Total watts input based on center conductor temp. of 220°F. Ambient 76°F.
- (2) RMS volts—with line at atmospheric pressure.

Chapter 8—COUPLINGS FOR BEAD SUPPORTED COAXIAL LINES

The following types of couplings are only a few of the many types that have been used in Service equipments. They are recommended in lieu of other types, as they offer less electrical discontinuity, and, if they are properly assembled to the line, require no maintenance.

Couplings for bead supported coaxial lines

AN type	Name	Category	Fig no.	Navy type	ANRFCCC or Navy draw. no.	Army or other type no.	Army or other draw. no.	Line code	Weather proof	Notes	Mfg. code

NOTES:

- (1) Less center contact. Uses knurled coupling ring in lieu of bolts to connect to male coupling. Pressurized. Has mounting flange.
- (2) Same as note 1 except no mounting flange.
- (3) With center contact. Mates coupling ring type coupling. Pressurized. Incorporates mounting flange.
- (4) Same as 3 except for 1 1/8" line.
- (5) With center contact, pressurized.
- (6) Same as 5 except for 70 ohm line.
- (7) Same as 5 except for 1 1/8" line.
- (8) Stub line type, male coupling with 4 hole square coupling plate, pressurized, with bullet type center conductor contact.
- (9) Pressure seal built into coupling.
- (10) Spring loaded solderless coupling, with or without gas admission valves, etc. Coupling for other size lines also available from this organization.
- (11) With 2 pipe-tapped holes for gas admission valve or gauge.
- (12) Designed for use with "Teflon", 7/8" rigid line.
- (13) Installation technique shown in restricted publication NavShips 900,579.

Chapter 9—STUB SUPPORTED COAXIAL LINES

A tabulation of stub lines is listed in this section. The useful band width of frequencies or power that can be transmitted through these lines is available to organizations cleared to receive such information. It should be noted that a specific line may be used only for that frequency band for which the stub is turned.

It is recommended that wave guides for ship or ground use be used in lieu of stub lines in new equipment design because of the greater ease of installation, maintenance and supply.

Stub supported coaxial lines

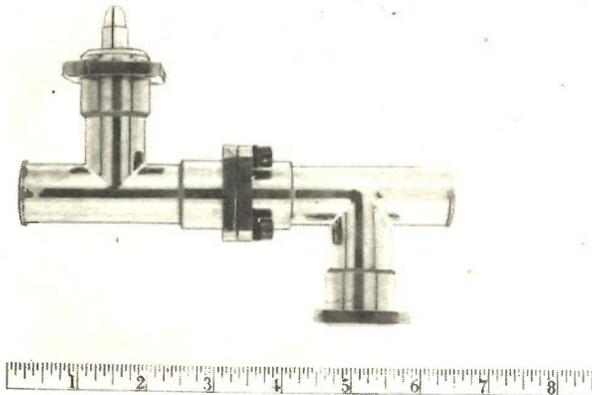

Figure 160.

Stub supported coaxial lines.

Chapter 10—COUPLINGS FOR STUB SUPPORTED COAXIAL LINES

The couplings listed are weatherproof and good for any frequencies or power for which the stub line is designed.

Any other couplings used in the past are not recommended for use in new equipments and should be procured for replacement use only.

Chapter II—MISCELLANEOUS NAVAL LINES AND FITTINGS

The following list of transmission lines, fittings and associated equipment has been prepared principally for the convenience of Naval activities. The listing has been prepared by the Naval Research Laboratory and contains components shown on their drawings.

This section contains its own manufacturer's index. The manufacturer's numbers, as listed herein, apply only to this section and should not be used or compared with those of any other section.

1. NAVAL RESEARCH LABORATORY ANACOSTIA, D.C., LISTING (Drawings and specifications available upon application to the Director, N. R. L.)

1/4" O.D. coaxial lines (70-ohm, gas filled)

30. Precision Development Company, Salisbury, Md.
31. Transcontinental Electronic Corp., 315-321 E. 42nd St., New York 10, New York.

Chapter 12—ROTARY JOINTS—SOLID DIELECTRIC

These joints have been developed for radars which use solid-dielectric r. f. cables to supply the r. f. signal to the antenna. The solid-dielectric rotary joint eliminates the necessity of pressurizing or dehydrating an air-dielectric type rotary joint.

The single coaxial joint can be used for transmission of frequencies and voltages which are limited only by the accessory cables and connectors in the line.

The duplex joints listed are for the specific band or frequency of the equipment noted. Other joints are also under development.

Rotary joints—solid dielectric

AN type	Name	Category	Fig no.	Navy type	ANRFCCC or Navy draw. no.	Army or other type no.	Army or other draw. no.	Cable code	Weather proof	Notes	Mfg. code
UG-162/U	Single Rotary Joint.....	2	162	RE 49F 338	8, 10 17, 18	Yes	(1, 2)	71, 20

UG-227/U	Duplex.....	2	RE 62F 362	8, 10 19, 20	Yes	(4)
UG-308/U	Single Rotary Joint.....	(5)	78

NOTES:

- (1) Use two UG-154/U plugs to connect RG-18/U cable to this unit.
- (2) By means of UG-252/U adapter, can be used with two UG-59/U plugs and RG-8/U R.F. cable.
- (3) For use with TDY equipment only.
- (4) Use two UG-156/U plugs to connect RG-19/U or equivalent and two UG-59A/U plugs to connect RG-10/U cables or equivalent.
- (5) Fits UG-59A/U plug.

Rotary joints—Solid dielectric.

Chapter 13—ROTARY JOINTS—AIR DIELECTRIC

As a result of lack of standardization in the past, many joints have been designed, each specific to a particular equipment. The present objectives of standardization of pedestals and antenna mountings will enhance standardization of these rotating joints. The types listed below include single coaxial and double concentric coaxial systems. The single coaxial units include 50 and 70 ohm characteristic impedance types. The drawings for each type listed may be obtained from the designer or from the component manufacturer.

Chapter 14—SPlicing TECHNIQUE FOR R. F. CABLES

The need for splices for flexible solid dielectric cables is increasing and the following information is given to meet the need for standard practice.

Navships 900,597 dated 20 March 1945 contains the latest information available for performing the splicing operations. Basically, five steps are required in making a splice:

- A. The joining of the inner conductors.
- B. The application of polyethylene dielectric over the inner joint and its continuity with the cables insulation.
- C. The splicing of the copper shields.
- D. The molding of the vinylite jacket.
- E. The joining of the outer armor.

Step E of course is omitted for all non-armored cables.

Splicing kits for several types of cables have been manufactured and are being distributed.

Tools and materials furnished with the splicing kits
